1 Roof requirements

Slope	≤3.0° (optionally with on-site connection to the roof substructure up to 10°)
Unevenness	≤+2.5°, ≤-2.5°, ≤±1.25° Base plates should lie flat against each other. Individual plants may need to be cut back or removed. Height differences in the substrate should be levelled out.
Substrate	For extensive greening with stable green roof substrate. Layer thickness according to manufacturer's specifications.
Coefficient of friction	Relevant for design, minimum requirement depending on wind load and field geometry
Permanent compressive strength	≥ approx. 10 kN/m ² (depending on boundary conditions)

4 Rated resistances of components and connections

In order to verify the resistance values of MSP-FR flat roof systems, the values of each component must be taken into account individually.

By the customer:

- Load-bearing capacity of the roof
- Compressive strength of the thermal insulation
- Static friction between the roof waterproofing and the protective layer
- Design value of the module according to the manufacturer's specifications

According to this data sheet:

- Support MSP-FR-EW-SL8/SL10
- Support high MSP-FR-EW-SH
- Support middle high MSP-FR-EW-SMH
- Adapter support MSP-FR-G-AS
- Connection channel MSP-FR-EW-C
- Ballast support MSP-FR-BT
- End clamp MSP-PR-EC/-ECB/-ECG/-ECBG
- Middle clamp MSP-PR-MC/-MCG/-MCB/-MCBG
- Complementary clamp low MSP-FR-LC/-LCB

The component with the lowest resistance is relevant for dimensioning.

All resistances are calculated in accordance with the following standards and guidelines:

- DIN EN 1990 (EC1)
- DIN EN 1993-1-1 (EC3)
- DIN EN 1999-1-1 (EC9)
- VDI 2230 Sheet 1
- DIBt approval: abZ Z-14.4-926

The resistance values only apply if the complete MSP-FR-G system from Schweizer is used and the installation is carried out in accordance with the MSP-FR-G PV mounting system MSP green roof installation instructions.
